

Meeting Summary: Bank Muamalat Collections Demo

This document summarizes the discussions, technical architecture, and customer interaction flows planned specifically for the **Bank Muamalat Collections Demo** as discussed in the sync meeting on July 3, 2026.

1. Overview & Strategic Priority

- **Strategic Status:** The Bank Muamalat demo is highlighted as one of the **two major priorities** (alongside Proton) for the upcoming Tuesday presentation.
- **Core Value Proposition:** A multi-channel, automated AI collections bot that initiates outreach to debtors (Days Past Due / DPD) and adapts its tone and solutions dynamically based on debtor responses.
- **Initiation Model:** Outreach is strictly **bot-initiated (outbound)**. The bot starts the conversation to remind the user of their obligation, rather than waiting for incoming queries.

2. Technical Setup & Multi-Channel Infrastructure

- **Multi-Channel Delivery:** The system must support delivery across three key communication channels requested by the client:
 - **WhatsApp** (Primary channel for interactive automated chats)
 - **SMS** (Fallback and urgent notification)
 - **Email** (Official correspondence fallback)
- **Twilio Configuration:**
 - Twilio balance is currently healthy (\$17 remaining from a recent \$20 reimbursement).
 - A dedicated Twilio number has been purchased specifically for **Bank Muamalat Collection** simulation.
 - This number will act as the uniform "sender identity" for outbound SMS/WhatsApp messages.

3. Collections Flow & DPD Tone Progression

The core of the demo revolves around how the AI bot alters its tone of voice and strategy based on how late the debtor's payment is (Days Past Due / DPD).

Phase 1: Early Stage (Soft Reminder / DPD 30)

- **Tone:** Friendly, polite, and helpful ("soft reminder").
- **Message Style:** "Just reminding you that your bill was due yesterday. Please make your payment..."
- **Bot Behavior:** If the user acknowledges and agrees, the bot responds in a friendly,

conversational tone ("bot manis") providing payment guidelines.

Phase 2: Mid Stage (DPD 60)

- **Tone:** Neutral, firm, and persistent.
- **Message Style:** Direct warning regarding accumulated outstanding payments and potential consequences on credit scores.

Phase 3: Late Stage (DPD 90 - 120)

- **Tone:** Assertive, authoritative, and direct ("mulai agak keras").
- **Escalation Path:** If the debtor passes critical DPD thresholds (e.g., 90+ days), the flow indicates transition to legal warnings or physical debt collector dispatch.

4. Interactive Scenarios & Dynamic Bot Adaptation

The team discussed two main conversational pathways depending on the debtor's reaction to the early/mid-stage reminders:

1. Hostile / Refusal Scenario:

- **Trigger:** Debtor responds negatively (e.g., "No, I don't want to pay," or aggressive responses).
- **Bot Reaction:** The bot's personality shifts dynamically, turning serious, official, and utilizing stiffer legal language.

2. Financial Hardship Scenario (Restructuring / "Rekonstruksi"):

- **Trigger:** Debtor responds with a valid struggle (e.g., "I'm having financial difficulties right now").
- **Bot Reaction:** The bot offers empathetic assistance and presents standard restructuring solutions.
- **Solutions Offered:** Waiving/reducing outstanding interest rates or proposing

installment extensions.

5. Next Steps & Timeline

- **Action Item (Yuda):** Set up the database linkages to feed the different debtor mock-data (sorted by DPD stages) into the playground environment.
- **Integration Testing:** Test the Twilio numbers locally to ensure outbound SMS/WhatsApp flows triggers perfectly.
- **Pre-Demo Alignment:** Run a mock-demo call on Monday to brief how both team members can present and test the flows cleanly on Tuesday.
